

This report summarizes all unintentional illicit drug toxicity deaths in British Columbia (accidental and undetermined) that occurred between January 1, 2012, and June 30, 2022, inclusive. It includes confirmed and suspected illicit toxicity deaths (inclusion criteria below). *Please note that data is subject to change as investigations are concluded.* <https://www2.gov.bc.ca/gov/content/life-events/death/coroners-service/statistical-reports>

Inclusion Criteria: The illicit drug toxicity category includes the following:

- Street drugs (Controlled and illegal drugs: heroin, cocaine, MDMA, methamphetamine, illicit fentanyl etc.).
- Medications not prescribed to the decedent but obtained/purchased on the street, from unknown means or where origin of drug not known.
- Combinations of the above with prescribed medications.

Note: 2022 data is up to the month of June. Due to the short time frame, rates, numbers, and percentages should be interpreted with caution and are subject to change as investigations are completed.

2022 Summary

- The total of 146 suspected illicit drug toxicity deaths represents a 17% decrease over the number of deaths in June 2021 (175) and is a 26% decrease from the number of deaths occurring in May 2022 (197).
- The number of illicit drug toxicity deaths in June 2022 equates to about 4.9 deaths per day.
- In 2022, 73% of those dying were aged 30 to 59, and 78% were male.
- The townships experiencing the highest number of illicit drug toxicity deaths in 2022 are Vancouver, Surrey, and Greater Victoria (see page 11).
- By Health Authority (HA), in 2022, the highest **number** of illicit drug toxicity deaths were in Fraser and Vancouver Coastal Health Authorities (352 and 297 deaths, respectively), making up 59% of all such deaths during 2022 (see page 12).
- By Health Authority (HA), in 2022, the highest **rates** were in Northern Health (53 deaths per 100,000 individuals) and Vancouver Coastal Health (47 per 100,000). Overall, the rate in BC is 42 deaths per 100,000 individuals in 2022 (see page 12).
- By Health Service Delivery Area (HSDA), in 2022, the highest **rates** were in Vancouver, Thompson Cariboo, Northern Interior, Northwest, and Fraser East (see page 17).
- By Local Health Area (LHA), in **2022**, the highest **rates** were in Lillooet, Mission, Terrace, Cariboo/Chilcotin, and Powell River (see page 18).

- In 2022, 84% of illicit drug toxicity deaths occurred inside (56% in private residences and 27% in other inside residences including social and supportive housing, SROs, shelters, and hotels and other indoor locations) and 15% occurred outside in vehicles, sidewalks, streets, parks, etc. (see page 5).
- In Vancouver Coastal, other residences (45%) were the most common place of illicit drug toxicity deaths followed by private residences (36%) between 2019 and 2022 (see Table 3, Page 5).
- No deaths have been reported at supervised consumption or drug overdose prevention sites.²
- There is no indication that prescribed safe supply is contributing to illicit drug deaths.

Trends

- Illicit drug toxicity death rates among all age groups have decreased this month (see Figure 6, Page 10).
- The proportion of deaths that are 50+ years of age has steadily increased year after year for the past 6 years. In 2022, 37% of decedents were at least 50 years old (see Figure 5, Page 9).
- Illicit drug rates in Northern Health have increased this month; death rates in all other health authorities have decreased (see Figure 7, Page 13).
- The detection rate of benzodiazepines has rapidly increased from 15% of samples in July 2020 to 52% of samples in Jan 2022. It has since decreased to 33% in June 2022.
- Between July 2020 and June 2022, etizolam was found in 39% of illicit drug toxicity deaths that have undergone expedited toxicological testing. Etizolam is a benzodiazepine analogue and non-opioid sedative that does not respond to naloxone and creates life-saving challenges for first responders.

BC Data by Drugs Involved:

- Preliminary data suggests that the proportion of illicit drug toxicity deaths for which illicit fentanyl was detected (alone or in combination with other drugs) was approximately 83% in 2022 and 86% in 2021. *2022 data will change as further toxicology results are received.*
- Post-mortem toxicology results suggest that there has been a greater number of cases with extreme fentanyl concentrations in Nov 2021-Jun 2022 compared with previous months (concentrations exceeding >50ug/L (micrograms/litre).
 - From Nov 2021-Jun 2022, approximately 17% of cases had extreme fentanyl concentrations as compared to 13% from Apr 2020 to Oct 2021 and 8% from Jan 2019 to Mar 2020.
- Carfentanil has been detected in 61 suspected illicit drug toxicity deaths in 2022 and 189 deaths in 2021. *This is subject to change as further toxicology results are received.*
- A review of completed cases from 2019-22 indicates that the top four detected drugs relevant to illicit drug toxicity deaths were fentanyl (86%), cocaine (45%), methamphetamine/amphetamine (42%), and other opioids (23%).
- There is no indication that prescribed safe supply is contributing to illicit drug deaths.
- Among the drug types involved in completed illicit drug toxicity death investigations, illicit fentanyl has increased from 5% in 2012 to 86% in 2021. Methamphetamine has also increased from 14% in 2012 to 41% in 2021. Cocaine and other opioids have steadily declined from 2012 to 2020; however, cocaine was involved in 47% of illicit drug toxicity deaths in 2021.

Notes:

1. The BCCS operates in a live database environment. Some data for more recent years is based on preliminary circumstances and is subject to change as investigations are concluded. Data are not directly comparable to published counts from previous years.
2. This does not include circumstances where the injury event occurred at an overdose prevention site and death occurred in hospital.
3. 2022 data includes January 1, 2022 to June 30, 2022.
4. Date of death was used in tables where date of injury was unknown.
5. Population estimates were taken from:
